Serial No.: 10/626,621

## IN THE CLAIMS

1. (currently amended) A threaded joint for steel pipes comprising a pin and a box each having a contact surface including a threaded portion and an unthreaded contact portion,

characterized in that the contact surface of at least one of the pin and the box is coated with a metallic undercoating layer and a lubricating coating layer thereon, the undercoating layer has a porosity of 5 - 80% and a thickness of 1 -  $30\mu m$ , the lubricating coating layer is comprised of a solid lubricating coating or a liquid lubricating coating, the latter containing substantially no heavy metal powders, and the total thickness of the undercoating layer and the lubricating coating layer is at most  $100~\mu m$ ?

wherein the threaded foint is used at high temperatures.

- 2. (original) A threaded joint for steel pipes as claimed in claim 1 wherein the undercoating layer has a hardness of 50 250 Hv.
- 3. (original) A threaded joint for steel pipes as claimed in claim 1 wherein the undercoating layer is formed by electroplating, blast coating, or flame spraying.
- 4. (original) A threaded joint for steel pipes as claimed in claim 1 wherein the undercoating layer is formed of a metal selected from Zn, Cu, Ni, Sn, Cr, Al, Co, preclous metals, and alloys thereof.
- 5. (currently amended) A threaded joint for steel pipes as claimed in claim 1 wherein the lubricating coating layer is a liquid lubricating coating which consists essentially of a basic metal salt of an organic acid selected from the group consisting of a basic metal sulfonate, a basic metal phenate, and a basic metal carboxylate orwhich contains a basic metal salt of an organic acid.
- 6. (original) A threaded joint for steel pipes as claimed in claim 1 wherein the lubricating coating layer comprises a solid lubricant and a binder which can form an organic or inorganic coating.
- 7. (original) A threaded joint for steel pipes as claimed in claim 2 wherein the undercoating layer is formed by electroplating, blast coating, or flame spraying.

Serial No.: 10/626,621

- 8. (original) A threaded joint for steel pipes as claimed in claim 2 wherein the undercoating layer is formed of a metal selected from Zn, Cu, Ni, Sn, Cr, Al, Co, precious metals, and alloys thereof.
- 9. (currently amended) A threaded joint for steel pipes as claimed in claim 2 wherein the lubricating coating layer is a liquid lubricating coating which consists essentially of a basic metal salt of an organic acid selected from the group consisting of a basic metal sulfonate, a basic metal phenate, and a basic metal carboxylate or which contains a basic metal salt of an organic acid.
- 10. (original) A threaded joint for steel pipes as claimed in claim 2 wherein the lubricating coating layer comprises a solid lubricant and a binder which can form an organic or inorganic coating.
- 11. (new) In a method of drilling for crude oil in a high temperature environment using steels pipes having threaded joints, the improvement comprising using the threaded joint of claim 1.
- 12. (new) A threaded joint of claim 1, wherein the lubricating coating layer and the metallic undercoating layer each define a thickness.
